

deposits

like the base layer, but:

- > secured by bonding
- > distributed state
- > low fees
- > very fast

Like Cashu, but:

- > state survives operator exit
- > full transparency
- > no protocol level privacy
- > key based wallets (not bearer tokens)
- > multisig capable

what's live today

- > four nodes
- > one meagerly funded ledger
- > three quorum members
- > reserves, collateral
- > lightning bridge
- > 1,000 bit limit
- > optional node-level pubkey or lightning address allowlisting
- > unencrypted nostr requests
